Findings Hoffenheim W

Clustering results

Hoffenheim was closely clustered with patient teams at k = 2 and k = 3. Then at k = 4, they were switched to central combiners by a margin of less than 1 percent.

Like patient teams

Hoffenheim was not one the most active teams when it comes to progressive passing, and they were not direct in build up. They had a lower share of final third entries via passes, and slightly lower than average when it comes to crosses. They were not active in engaging in counterpress actions.

Like central combiners

A significant proportions of their carries into the final third ended up centrally, and they also attempted more through balls. Few of their completed box entries via passes were crosses.

Pitch profile

A quarter of their attacks went down the middle. Right side was more favoured than left side, especially with touches.

Formations and typical XI

Hoffenheim mostly used 4-2-3-1 and 4-3-3 formations. While only using back three formations 2% of the time, they used wingerless formations 11% of the team, mostly the 4-1-2-1-2 formation.

For their main formation 4-2-3-1, goalkeeper, center backs, and left winger were the only stable positions. Most other positions saw significant rotations, with Linder being another regular player but was usually rotated between two full back positions.

Similar teams

Hoffenheim was built similarly to Manchester City and Duisburg, while played similartly to Bayern. These are the three teams that were similar to Hoffenheim on either build or style and overall.
