Findings FC Internazionale Milano W

Clustering results

Inter was clustered with front-footed teams at k = 2, then switched to patient teams at k = 3, then wide crossers at k = 4. Eventually the split between all clusters were roughly equal for all values of k.

Like patient teams

Inter was not the most active team when it comes to progressive passing but more active on into the final thid carrying. They did not attempt many through balls. They were not as active in counterpressing, and did not defend highly.

Like front-footed teams

Fewer of their shots came from open play, while they had a higher share of box entries via passes. A higher proportion of their shots was after direct set piece situations.

Like wide crossers

Less of their attacks went down the left, and less of their final third entries went down the middle. Among completed passes into the box, a high proportion of these passes was on crosses.

Pitch profile

A quarter of Inter's attacks went through the middle, while they used their right channel much more than the left.

Formations and typical XI

Inter mostly used the 4-2-3-1 formation. They used back three formations 21% of the time and wingerless formations 23% of the time, with 3-5-2 being the third most used formation.

For their main formation 4-2-3-1, stable positions include Cetinja at goalkeeper, Thogersen at right back, Robustellini at left back, Csiszar as one of defensive midfielders and Milinkovic mostly being her partner on the right, Magull at attacking midfielder, and Bonfantini as right winger. Other positions saw significant rotations throughout the season.

Similar teams

Inter had quite many close teams both in terms of build and style, although there was not much overlap between these two. Only Real Madrid was similar on build and Como was similar on style that ended up in top 5 similarity overal.
